Nonimaging optics (also called anidolic optics) is the branch of optics concerned with the optimal transfer of light radiation between a source and a target. Unlike traditional imaging optics, the techniques involved do not attempt to form an image of the source; instead an optimized optical system for optimal radiative transfer from a source to a target is desired.

$L_{Object}$  = Luminance of the object.  $L_{Background}$  = Luminance of the background. If we use the luminance values shown in the upper portion of the figure we can calculate that the lower portion of the cylinder, where the roadway is the background, has a contrast of  $(1-22)/22 = -0.95$ , with the negative value denoting that it is negative contrast.

Atmospheric optics deals with how the unique optical properties of Earth's atmosphere cause a wide range of spectacular optical phenomena. The blue color of the sky is a direct result of Rayleigh scattering, which redirects higher frequency sunlight back into the field of view of the observer. Because blue light is scattered more easily than red light, the Sun takes on a reddish hue when it is ...

PROBLEM POSING. Students have asked me, on several occasions, "Is there any math after calculus?" These students have been given the impression that the world of mathematics is both finite and linear (the classic algebra-through-calculus sequence).

Back to Commercial Unstabilized HeNe Lasers Sub-Table of Contents.; Forward to Commercial Stabilized HeNe Lasers. Introduction This chapter has information on common commercial HeNe lasers with internal or external mirrors that do not have active stabilization, which is the vast majority of common models both in current production, and of historical interest.
