Monte Carlo methods (or Monte Carlo experiments) are a broad class of computational algorithms that rely on repeated random sampling to obtain numerical results. Their essential idea is using randomness to solve problems that might be deterministic in principle. They are often used in physical and mathematical problems and are most useful when it is difficult or impossible to use other approaches.

In computer science, Monte Carlo tree search (MCTS) is a heuristic search algorithm for some kinds of decision processes, most notably those employed in game play. The leading examples of Monte Carlo tree search are recent computer Go programs, followed by chess and shogi, as well as real-time video games (such as Total War: Rome II's implementation in the high level campaign AI) and games with ...

I Metodi Monte Carlo sono un'ampia classe di metodi computazionali basati sul campionamento casuale per ottenere risultati numerici. Può essere utile per superare i problemi computazionali legati ai test esatti (ad esempio i metodi basati sulla distribuzione binomiale e calcolo combinatorio, che per grandi campioni generano un numero di permutazioni eccessivo).

Monte Carlo-metoder är ett samlingsnamn för en viss typ av matematiska algoritmer som bygger på slump. Monte Carlo-metoder kan användas för att lösa vissa problem som svåra att lösa med konventionella deterministiska metoder, bland annat för att simulera fysikaliska system (till exempel molekylodynamik) eller göra vissa statistiska beräkningar.
